Soft-Sided Shelter

The Fairborn Series 2200 Soft-Sided Dock Shelter saves energy dollars while providing airtight protection to the loading dock area during material handling operations. The Series 2200 combines the insulating qualities of a dock seal with the access and service range of a dock shelter into one versatile product offering.

Accept no substitutes! The Fairborn Shelter-Seal is designed to accommodate larger door openings where full access to the truck as well as a good environmental seal is desired. The Series 2200 Shelter-Seal is ideal for narrow door center line applications or where damage to conventional rigid framed shelters is a concern.

The structurally supported head member is made of translucent fiber glass to allow natural light into the loading operation. The self supporting and raked nature of the head frame provides adequate snow load protection and deflects rain from the loading operation.

To ensure maximum durability, the Series 2200 Shelter-Seal is available in our superior performance materials. Fairborn created the first certified performance fabric designed solely for the construction of seals and shelters. Our exclusive materials meet or exceed the most demanding requirements and have proven to out-perform any fabric in today's dock shelter market.

Unique Head Member

- Structurally self-supported
- Translucent for natural light infiltration
- Integral canopy to protect workers from the elements
- Raked to deflect rain and prevent snow & ice build up.
- Strong to support snow load
